

Films processed by MUJICA, treated transparent OPP films, recycled pellets and molded products

C2-G2 unveiled for the first time

This is how the H2-C2 can be used. It loads the plate cylinders to H2-C2 in the gravure plate making room (if a robot arm is installed in the plate making room, loading can be done automatically) and it moves autonomously

to a predetermined location, for example, to the entrance of the printing room. Next, two C2-G2s waiting at the printing room receive the plate cylinders from H2-S2 one by one, move to their respective printing units, and

raise their arms to set the plate cylinders in certain positions. The gravure cylinders that can be transported have a maximum length of 1300mm, a circumference of 400 to 900mm, and a maximum weight of 60kg.
